

THE SIGNED LAND ACCOUNT

EDGAR 2026 · Section 3, Figure 6 and Annex 2 · 2025 estimates

Other / rounding remainder: ≈-0.6 GtCO<sub>2</sub>e is a closure diagnostic, not an independently extracted category total.

**Disjoint land categories, separate gas denominator.** Forest Land already includes land converted to forest; no extra afforestation or regrowth subtotal is added. Deforestation includes tropical forest-fire CO<sub>2</sub>, which is excluded from Fires; tropical fire non-CO<sub>2</sub> gases remain in Fires. Organic Soils’ quoted 1.1 is CO<sub>2</sub> only. The diagnostic remainder  $0.9 - [3.7 - 5.5 + 2.2 + 1.1] \simeq -0.6$  also absorbs omitted subcomponents and rounding; it is not a separately extracted Other estimate. Source: Crippa et al. (2026), booklet Sections 2–3 and Annex 2, doi:10.2760/7717504 (CC BY 4.0).

**Figure 1: The reported 2025 account and its boundaries.** The sector–activity–gas organization is adapted from WRI (2005) and Ecofys (2013), with author-created vector artwork and a separate five-category signed land account. Intermediate activity nodes describe pathways, rather than EDGAR’s official sector list. Gas shares refer only to EDGAR’s 54.1 GtCO<sub>2</sub>e non-LULUCF inventory using AR5 GWP<sub>100</sub>; 73.8% is fossil CO<sub>2</sub>. Land emissions therefore do not enter that gas block. The reverse dashed link denotes Forest Land’s net removal. Forest/deforestation estimates use a global Tier 1 approach with default parameters and estimated activity data beyond the latest input maps, not independently remeasured 2025 carbon densities. Paths and all graphical areas are schematic, not a balanced quantitative Sankey. Electricity-attribution paths must not be counted again as direct emissions.

**Figure 2: Structural forest-carbon bias and unresolved attribution.** The hatched green branch denotes an unresolved remeasurement; its size has no quantitative interpretation. The organization adapts the WRI/Ecofys source–activity–gas convention; reverse removal pathways emphasize the paired analysis; regrowth and other forest accumulation denote disjoint conceptual subsets, not additional EDGAR subtotals. Muted sectors, the question mark and bidirectional arrow retain three alternatives: a larger total, redistribution within a retained total, or joint revision of sources and removals. The inset diagnoses the historical reassessment using the Ecofys (2013) chart; neither interval is an uncertainty bound or a validated correction. The 723.97 PgC extrapolation is audited in Section 3, stock-to-flux transfer in Section 5, paired, regrowth and size-dependent corrections in Section 6, and original-denominator provenance in Section 7.
